Three Learning Goals

Deepen your understanding of the psychological framework underlying CCL's organizational practices.

1

Learn about unexpected patterns to incorporate as more effective strategies.

2

Reflect on strategies as a climate advocate to improve our approach.

3

Our Agenda

- 1 Theoretical Background
- 2 Framework For Overcoming Barriers
- 3 Data & Findings
- 4 Implications for Advocacy & Training
- 5 Q&A Discussion

Theoretical Background

Climate Change Impacts Worldwide

Climate change made European heatwave at least five times likelier

Searing heat shows crisis is ‘here and now’, say scientists, and worse than predicted

▲ A plane drops water over a wildfire on the edge of Cenicientos, central Spain, in June. Photograph: Pierre-Philippe Marcou/AFP/Getty Images

The record-breaking heatwave that struck France and other European nations in June was made at least five – and possibly 100 – times more likely by climate change, **scientists have calculated**.

Such heatwaves are also about 4C hotter than a century ago, the researchers say. Furthermore, the heatwaves hitting **Europe** are more frequent and more severe than climate models have predicted.

Last month was the hottest June since 1880, both in Europe and around the world, according to **separate data released on Tuesday** by the EU’s Copernicus Climate Change Service. In Europe the temperature was 3C above the June average a century ago, and globally it was more than 1C higher.

Abstract

Psychological scientists have the expertise—and arguably an obligation—to help understand the political polarization that impedes enactment of climate policy. Many explanations emphasize Republican skepticism about climate change. Yet results from national panel studies in 2014 and 2016 indicate that most Republicans believe in climate change, if not as strongly as Democrats. Political polarization over climate policy does not simply reflect that Democrats and Republicans disagree about climate change but that Democrats and Republicans disagree with each other. The results of a national panel experiment and of in-depth interviews with four former members of Congress suggest that Democrats and Republicans—both ordinary citizens and policymakers—support policies from their own party and reactively devalue policies from the opposing party. These partisan evaluations occur both for policies historically associated with liberal principles and politicians (cap-and-trade) and for policies associated with conservative principles and politicians (revenue-neutral carbon tax). People also exaggerate how much other Democrats and Republicans are swayed by partisanship. This foments false norms of partisan opposition that, in turn, influence people's personal policy support. Correcting misperceived norms of opposition and decoupling policy evaluation from identity concerns would help overcome these seemingly insurmountable barriers to bipartisan support for climate policy.

The following is a guest post by social psychologists [David Sherman](#) (University of California, Santa Barbara) and [Leaf Van Boven](#) (University of Colorado, Boulder).

“Just because you have divided government, doesn’t mean you don’t accomplish anything.” “The resounding message, not just of this election, but basically the last several, is get stuff done. Don’t worry about the next election. Don’t worry about party affiliation.” Many citizens read these quotes as interchangeable and strongly endorse their sentiment. The first is from [Sen. Mitch McConnell](#), the second from [President Obama](#). The quotes’ interchangeability illustrates that there is both consensus and awareness that citizens want change from the [most polarized and least productive Congress in](#)

The Citizens Climate Lobby took an affirming approach when meeting with a Republican congressional representative (Bornstein, 2017, NYT). They expressed to the representative their “appreciation for his service in Iraq and in the State Senate before mentioning anything about climate change.” In response, the Republican congressman said, “I just have to say, you guys are not normal. You’re smiling, you’re saying nice things about me. That’s not what people like you do when you come into my office.” The congressman’s reaction—he signed on to the group—demonstrates the importance of affirming common goodwill and establishing personal connection.

(Van Boven, Ehret, & Sherman, 2018)

Abstract: Citizen activists play a role in translating public concern about the climate crisis to policymakers and elevating it on the political agenda. We consider the dynamic between citizen activists and the decision-makers they seek to influence and we review psychological research relevant to advocating for climate legislation. We conducted a study with citizen activists who lobby the US Congress for a carbon pricing policy to address climate change. The study assessed how activists think about four social psychological approaches: affirmation, social norms, legacy and immediacy. The findings provide a window into activists' intuitions about which strategies to use, whom to use them with and their perceived effectiveness. A strategy of establishing shared values and common ground (affirmation) was used most frequently overall. A strategy emphasizing the long-term costs and benefits of addressing climate change (legacy) was employed less frequently than affirmation and seen as less effective by activists but it was the only strategy that was associated with perceived increases in Congressional Representatives' support of the policy. Citizen activists and their interactions with elected officials provide an opportunity for social-behavioral scientists to understand and potentially overcome barriers to enacting climate policy.

Professor Hahrie Han
Johns Hopkins University
CCL Advisory Board Member

The Exchange Between Citizens and Elected Officials: A Social Psychological Framework

- Citizen activists translate public concern about climate to decision makers and policy makers and elevate climate on the political agenda

Greta Thunberg of Sweden

There is a revolutionary importance in the relationship between us citizens and our local leaders. Whether members of Congress, mayors or city council members, people in positions of power hold the key to inducing change. By creating relationships with these leaders, we are granted the opportunity to voice our opinion and push towards the solutions necessary to put an end to climate change.

– *Daily Camera*, Letter to the Editor, Alyssia Chinda (2019)

Framework For Overcoming Barriers

Overview of Four Main Strategies

- **Affirmation** of shared values can reduce defensiveness to promote open-mindedness and dialogue.
- Providing accurate information about **descriptive norms** related to carbon pricing policies can dispel misinformation.
- Making **legacy** salient can lead to long-term perspective that motivates action for future generations.
- Increasing **immediacy** can instigate immediate focus on pragmatics and decrease ideological focus.

Participants

- 352 Citizen Activists
(part of national organization)
 - 264 completed pre-test before November 9, 2018
 - 292 completed post-test after election and lobbying efforts in Washington DC
 - 204 completed both pre-test and post-test
- **Method:** Present activists with psychological grounded strategies (derived both from theory and from study of organizational practices)

CCL's Lobby Training

Lobbying at its core is about building relationships with individuals or groups with decision-making power. Doing it well requires cross-functional skills, including listening, effective communication, and organized meeting management.

Affirmation

Establishing **Shared Values** (Optimism, Relationships, Integrity, Being Non-Partisan) in a context to highlight that staff and volunteers share common ground and can work together towards public support for policy solutions grounded in these values that manage the risks of climate change.

- Optimism – believing in people and democracy, and working towards solutions
- Relationships – being generous and respectful in order to build consensus
- Integrity – do plenty of research to achieve information, not opinions
- Being Nonpartisan – welcoming everyone, working with different officials on different ends of political spectrum to make allies out of everyone

The purpose of establishing **Shared Values** is to demonstrate that CCL volunteers want to work with the member and their office to arrive at solutions grounded in their valid concerns towards addressing climate change.

Norms

Being a **Trusted Messenger**, or sharing local leader and constituent letters that communicate information about Americans who support a carbon fee and dividend policy, via highlighting:

- The data from their legislative district on the actual support for carbon pricing policies of their constituents.
- The impressive list of “notable US businesses organizations” who do support carbon fee and dividend.
- The newspaper editorials calling for carbon fee and dividend.
- The local governments and individuals from the member’s community who also support carbon fee and dividend.

The purpose of being a **Trusted Messenger**, or sharing local leader and constituent letters, is to dispel misinformation about support for carbon pricing policy by showing the actual support.

Legacy

To establish the **Long Term** costs of climate change, volunteers tell personal stories about how the climate has already changed in their personal experience and discuss what the long term costs will be to future generations. Also, by highlighting national studies like the REMI (Regional Economic Models, Inc.) Report (that studied the effect of a revenue-neutral carbon price on the American economy) and the economic benefits that many studies find when putting a price on carbon, volunteers will illustrate the long-term economic benefits of climate change prevention, focusing on a positive vision of the future that includes new, well-paying jobs.

The purpose of presenting **Long Term** costs and benefits is to encourage thinking about the harms that climate change is presenting to future generations.

Immediacy

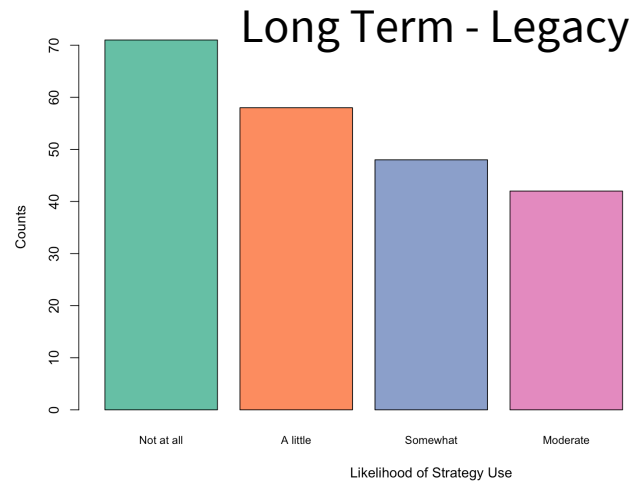

Discussing the connection between **Extreme Weather and Climate** to stress the immediacy of climate change and its negative impacts:

- Climate change increases the likelihood of flooding, drought, and wildfires while increasing their intensity and duration
- Current data show that each of these trends has been increasing over time
 - The problem is very current and is hurting the US economy

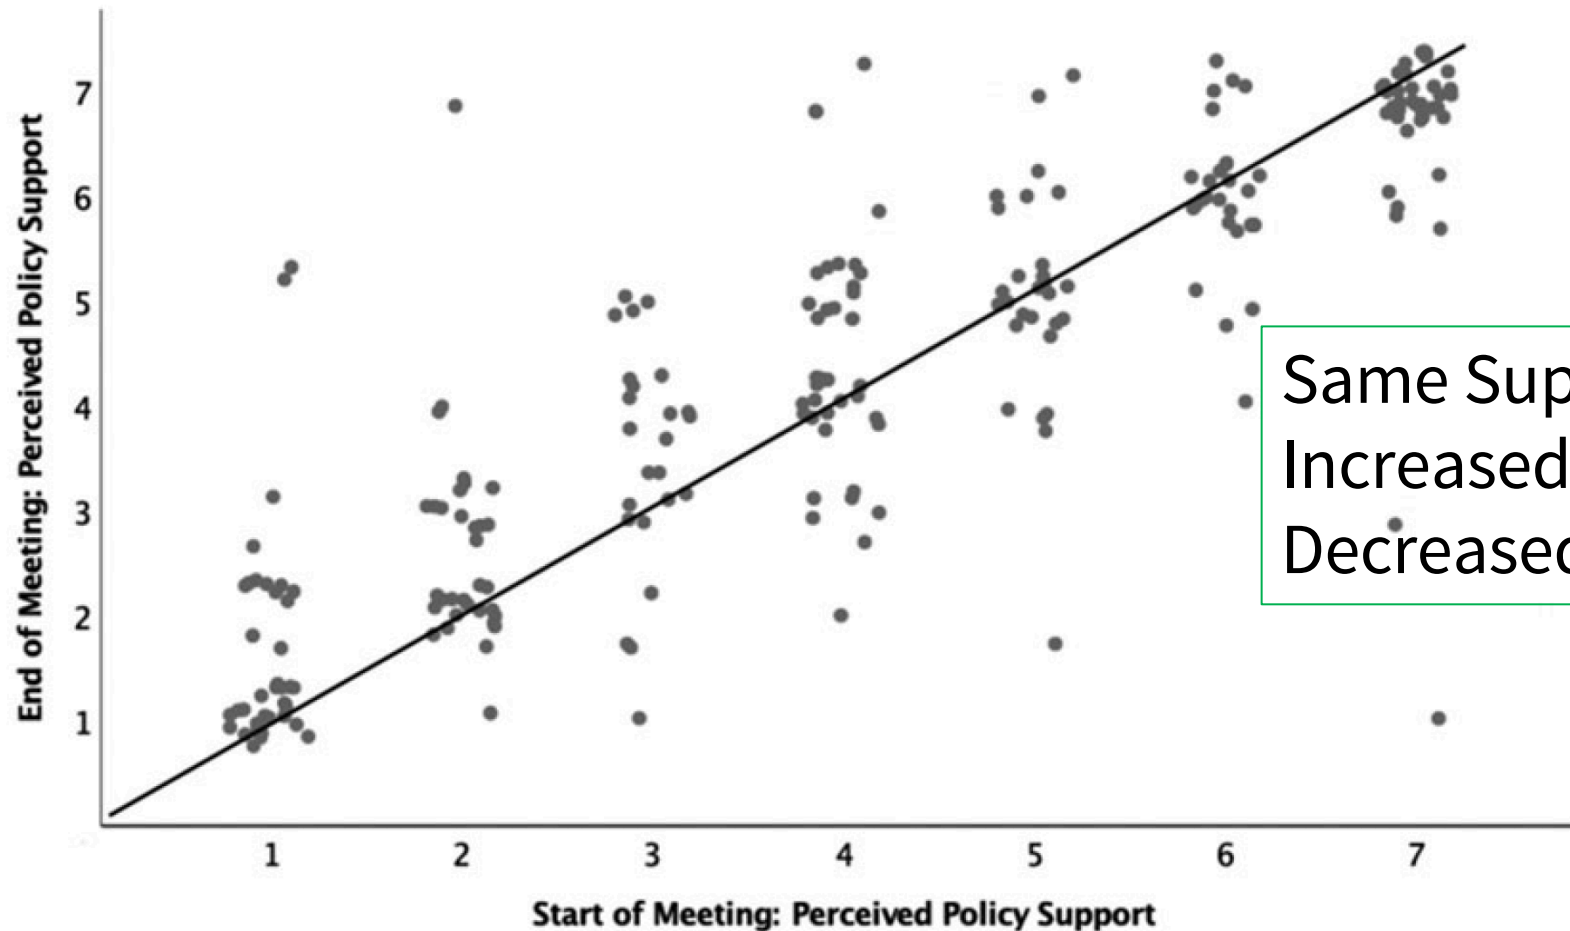

The purpose of discussing the connection between **Extreme Weather and Climate** is to highlight the alarming trends and immediate costs that leaving climate change unaddressed continues to impose.

Data & Findings

How much did participants report using strategies?

Perceived Policy Support of CR

Did the use of strategy vary as a function of perceived initial support?

Interaction for Mixed Model ANOVA:
 $F(6, 705) = 2.33, p = .031$

What strategies were most associated with perceived increases in support among CR?

	End of meeting: perceived policy support				
	<i>B</i>	SE	β	Lower	Upper
Constant	0.57	0.32		-0.06	1.20
Start of meeting: support	0.83	0.03	0.86**	0.77	0.90
Trusted Messenger – Norms	-0.05	0.05	-0.04	-0.15	0.05
Shared Values – Affirmation	0.07	0.07	0.04	-0.06	0.20
Extreme Weather – Immediacy	-0.05	0.05	-0.03	-0.15	0.06
Long-Term – Legacy	0.13	0.06	0.09*	0.02	0.24

* $p < 0.05$, ** $p < 0.001$.

Legacy used with those who were perceived to support the policy at the end of the meeting (controlling for initial support)

Caveats and Limitations

- Correlation \neq Causation
- These strategies, to the extent they are effective, may not be equally effective for all audiences
- The outcome variable of perceived support is based on retrospective assessments of meetings by participants (not actual support)
- No objective measure of strategy use

Implications For CCL's Advocacy & Training

Checklist: Structured Introspection

- Errors of “**not knowing**” and errors of “**not using what we know**” (Atul Gawande, *The Checklist Manifesto*)
- Structure: Which strategies should I use?
- Introspection: Have I implemented each strategy?
- Structured introspection undoes both errors
 - Reduces reactive devaluation
 - Increases concern for others
